

Gaps& **Growth**

Strengthening the Foundations Workbook KS4 Chemistry Students will need a copy of the examination board periodic table.

Strengthening the Foundations www.pixl.org.uk

Hello!

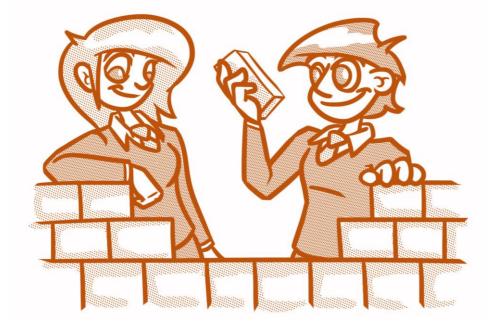

Even in the best of times, not everything goes to plan. Things happen – things we cannot control - which affect our learning. It is nothing to worry about. We all have strengths and weaknesses; we all have to work hard to achieve our goals. Remember, your teachers know what you are good at and they know what you find difficult. They will support you.

In all subjects you learn at school, or college, there are important concepts and ideas which help you to understand a topic and provide the foundations for future learning. If you don't have solid foundations, the rest of your knowledge will be unstable and not as secure as it could otherwise be.

The purpose of this workbook is to make sure your foundations are stable so that you can build the rest of your learning on it and have the strongest bank of knowledge and skills as possible.

Creating a stable foundation takes regular practice. We hope that this booklet will help you on your journey.

So, let's practise!

How to use this booklet.

- Read the 'recapping the foundations' section of the booklet (see below). You can refer to this when you answer the questions.
- Answer the questions in the brick walls on pages 5 and 6 start at the bottom of each wall.
- When you have answered the question in a brick, colour it in red, amber or green depending how confident you feel.

Recapping the foundations

Maths in chemistry

Standard form

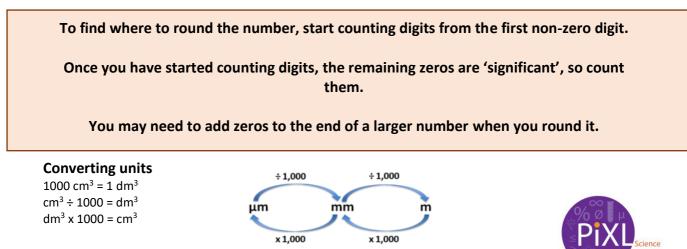

Standard form numbers are often used for very large measurements (for example, distances in astronomy) or very small ones (for example, the mass of a grain of sand). Multiplying a number by a power of 10 changes the place value of each of its digits. It can make the number bigger or smaller.

A number in standard form looks like this: $a \times 10^n$ where $1 \le a < 10$ and n is an integer (a "whole number").

The decimal point appears to move by the same number of places as the index on the power of 10 (in fact, the digits move and the decimal point stays put). If a number is very small (less than 1, i.e. starting with 0. ...) then the index will be a **negative** number.

Significant figures

Rounding numbers is intended to make them easier to work with. It is not about changing their size. If a number is rounded off, it will still be about the same size as it was before. Decimal places can be useful, but **significant figures** are generally the best way to round off a number in a scientific context. Remember, as with decimal places, to use the 'deciding digit' to decide whether to round the number down (if the 'deciding digit' is 4 or lower) or to round up (if the 'deciding digit' is 5 or higher).

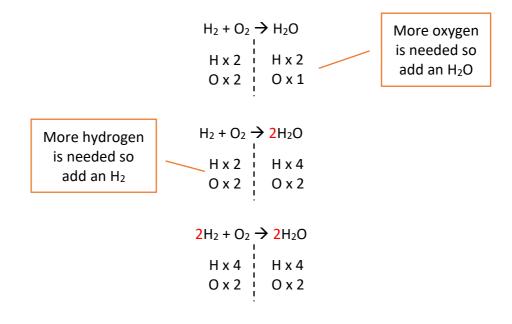

Balancing equations

To balance an equation:

- Check to see if the numbers of atoms of each element on the left is the same as the number on the right.
- Deal with only one element at a time.
- You cannot change any of the small numbers in a chemical formula. If balancing is required, put the number **in front** of the substance.

Relative formula mass

The **relative formula mass (Mr)** of a compound is the sum of the **relative atomic masses (Ar)** of the atoms in the numbers shown in the formula. The relative atomic masses can be found in the periodic table.

NaCl (1 x Na) + (1 x Cl) A _c : Na (23) Cl (35.5)	$Al_{2}(SO_{4})_{3}$ $(2 \times Al) + (3 \times 5) + (12 \times O)$ $\underline{A}_{t}: Al (27) S (32) O (16)$
M _r = 23 + 35.5 = 58.5	M _r = (27x2) + (32x3) + (16x12) = 342

Mass number and atomic number

12 — C	Relative atomic mass (Ar) = mass of protons + neutron						
6 —	Atomic or proton number = number of protons						

Atoms, ions and charge

In an **atom** the number of protons equals the number of electrons so there is no overall charge. In a **positive ion** there are more protons than electrons, e.g. in a Ca²⁺ ion there are two more protons than electrons. In a **negative ion** there are more electrons than protons, e.g. in a O²⁻ ion there are two more electrons than protons.

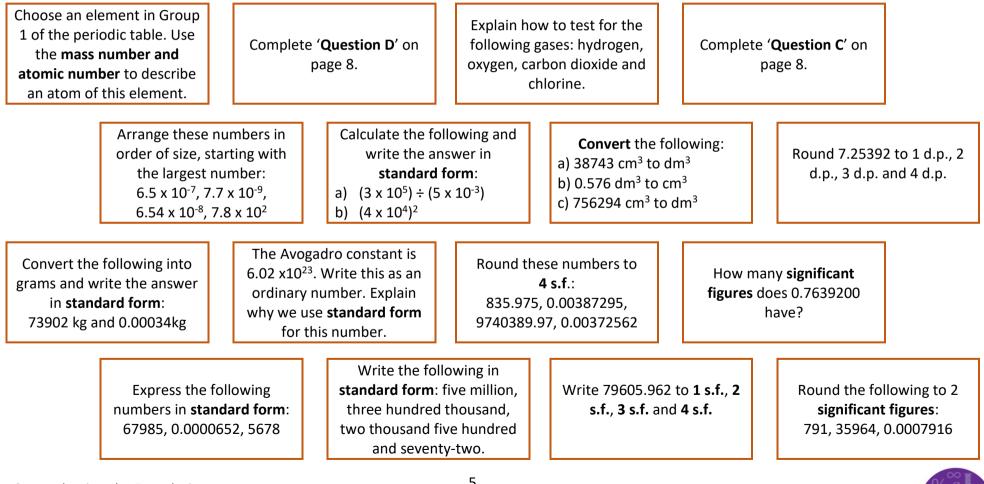

Strengthening the foundations

When a builder builds a brick wall, they start with the foundations at the bottom. On the wall below, the activities at the bottom are easier and they become more difficult as you move up the wall and build on the foundations you started with.

- Start with the activities at the bottom and work your way up the wall.
- RAG-rate each brick you complete by colouring it in red, amber or green to represent how confident you felt about that task. •

Question A

Look at the following graph showing the time taken for a reaction to occur at different temperatures.

- Draw a line of best fit.
- Describe the trend.
- Explain the trend.

Question B

Calculate the concentration (mol/dm³) for the following (some questions will require you to convert the units):

Show all of your workings to a maximum of 2.d.p.

- 0.65mol of HCl in 2dm³ water
- 2mol of H₂SO₄ in 2dm³ water
- 2mol NaOH in 0.75dm³ water
- 2mol NaOH in 100cm³ water
- 0.5 mol HCl in 1500cm³ water

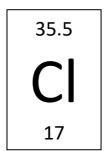

Question C

The box below has been taken from the periodic table. It contains information about an element.

Write down as much information about this element as possible. Remember to use the two numbers to help you.

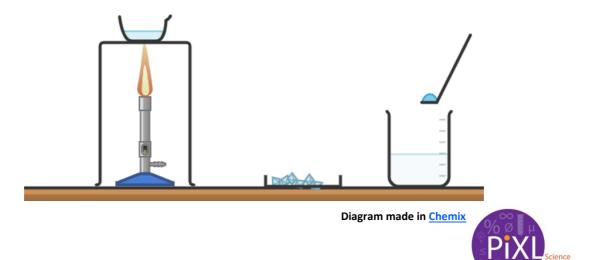

Question D

Look at the following method for chromatography.

- Draw a pencil line across the chromatography paper about 1 2 cm from the bottom.
- Use a pipette or capillary tube to add small spots of each ink to the line on the paper.
- Place the paper into a container with a suitable solvent in the bottom.
- Allow the solvent to move through the paper, but remove the chromatogram before it reaches the top.
- Allow the chromatogram to dry, then measure the distance travelled by each spot and by the solvent.

For each step in the above method, list the equipment needed and explain why that step is needed.
